

## Hawk Cloud Bug List

-The user disk quota chart sometimes does not render. A simple page refresh in the browser will render the graph on the page though.

The user disk quota chart is actually tracking the total memory used by all files and not one particular user.

-The account drop down in the nav bar does not close/open the items inside it (profile, settings, log out). Research suggests that how JQuery is being included in the application.js file is not working for the project, but we were unable to get it to work properly with the suggested fixes.

-The Log out link on the nav bar is in black text making it hard to read on the dark background (this is not so much a bug as it is a bad design choice).

-When logged in, you can edit and delete documents that belong to another user. Also so long as you are logged in you can upload documents as another user.

-When creating a new document i.e uploading a document, the file also gets downloaded into the download folder on clicking "Create Document".

The edit button tries to upload a file and causes an error on the page.

-On the new document page you can select which user to upload as based on their user\_id.

-You have to select a folder to upload a document to, you can't upload a document without uploading it to a folder
